D. Little Elephant and Array

time limit per test: 4 seconds

memory limit per test: 256 megabytes

The Little Elephant loves playing with arrays. He has array a , consisting of n positive integers, indexed from 1 to n . Let's denote the number with index i as a_i .

Additionally the Little Elephant has m queries to the array, each query is characterised by a pair of integers l_j and r_j ($1 \leq l_j \leq r_j \leq n$). For each query l_j, r_j the Little Elephant has to count, how many numbers x exist, such that number x occurs exactly x times among numbers $a_{l_j}, a_{l_j+1}, \dots, a_{r_j}$.

Help the Little Elephant to count the answers to all queries.

Input

The first line contains two space-separated integers n and m ($1 \leq n, m \leq 10^5$) — the size of array a and the number of queries to it. The next line contains n space-separated positive integers $a_1, a_2, \dots, a_n$ ($1 \leq a_i \leq 10^9$). Next m lines contain descriptions of queries, one per line. The j -th of these lines contains the description of the j -th query as two space-separated integers l_j and r_j ($1 \leq l_j \leq r_j \leq n$).

Output

In m lines print m integers — the answers to the queries. The j -th line should contain the answer to the j -th query.
